10 things (maybe) you didn't know about GenomicRanges, Biostrings, and Rsamtools

Hervé Pagès hpages.on.github@gmail.com

June 2016

1. Inner vs outer metadata columns

GRangesList object of length 3:

> grl

\$gr1

> mcols(grl)\$id <- paste0("ID", seq_along(grl))</pre>

```
GRanges object with 1 range and 2 metadata columns:
     seqnames ranges strand |
                               score
       <Rle> <IRanges> <Rle> | <integer> <numeric>
 [1]
      Chrom2
                 3-6 + I
                                        0.45
 seqinfo: 2 sequences from an unspecified genome; no seqlengths
$gr2
GRanges object with 2 ranges and 2 metadata columns:
     seqnames ranges strand |
                               score
                                          GC
       <Rle> <IRanges> <Rle> | <integer> <numeric>
 [1] Chrom1 7-9 + |
                                         0.3
 [2]
      Chrom1 13-15 - |
                                         0.5
 seqinfo: 2 sequences from an unspecified genome; no seqlengths
$gr3
GRanges object with 2 ranges and 2 metadata columns:
     segnames ranges strand |
                               score
       <Rle> <IRanges> <Rle> | <integer> <numeric>
 [1]
     Chrom1 1-3 - | 6
                                       [2]
      Chrom2 4-9 - |
```

1. Inner vs outer metadata columns

```
> mcols(grl) # outer mcols
DataFrame with 3 rows and 1 column
            id
   <character>
           ID1
gr1
gr2
           ID2
gr3
           ID3
> mcols(unlist(grl, use.names=FALSE)) # inner mcols
DataFrame with 5 rows and 2 columns
     score
                  GC
  <integer> <numeric>
         5
            0.45
           0.30
3
         4 0.50
         6 0.40
```

0.10

2. invertStrand()

Works out-of-the-box on any object that has a strand() getter and setter ==> no need to implement specific methods.

> gr

GRanges object with 10 ranges and 2 metadata columns: ranges strand | GC segnames score <Rle> <IRanges> <Rle> | <integer> <numeric> chr2 1-10 1 1.000000 а chr2 2-10 + | 2 0.888889 b chr2 3-10 3 0.777778 chr3 8-10 + I h 8 0.222222

```

extractList()

Extract groups of elements from a vector-like object and return them in a list-like object.

```
> cvg <- Rle(c(OL, 2L, 5L, 1L, OL), c(10, 6, 3, 4, 15))
> cvg
integer-Rle of length 38 with 5 runs
 Lengths: 10 6 3 4 15
 Values: 0 2 5 1 0
> i \leftarrow IRanges(c(16, 19, 9), width=5, names=letters[1:3])
> i
IRanges object with 3 ranges and 0 metadata columns:
        start
                    end
                            width
    <integer> <integer> <integer>
           16
                     20
                                5
  a
                                5
  b
           19
                     23
                     13
  C.
```

extractList()

```
> extractList(cvg, i)
RleList of length 3
$a
integer-Rle of length 5 with 3 runs
 Lengths: 1 3 1
 Values : 2 5 1
$b
integer-Rle of length 5 with 2 runs
 Lengths: 1 4
 Values: 51
$c
integer-Rle of length 5 with 2 runs
 Lengths: 2 3
 Values: 02
```

extractList()

```
i can be an IntegerList object:
> i <- IntegerList(c(25:20), NULL, seq(from=2, to=length(cvg), by=2))
> i
IntegerList of length 3
[[1]] 25 24 23 22 21 20
[[2]] integer(0)
[[3]] 2 4 6 8 10 12 14 16 18 20 22 24 26 28 30 32 34 36 38
> extractList(cvg, i)
RleList of length 3
[[1]]
integer-Rle of length 6 with 2 runs
  Lengths: 2 4
  Values: 0 1
[[2]]
integer-Rle of length 0 with 0 runs
  Lengths:
  Values :
[[3]]
integer-Rle of length 19 with 5 runs
  Lengths: 5 3 1 2 8
  Values: 0 2 5 1 0
```

4. 'with.revmap' arg for reduce() and (now) disjoin()

> ir

IRanges object with 6 ranges and 2 metadata columns:

	start	end	width		id	score
	<integer></integer>	<integer></integer>	<integer></integer>	1	<character></character>	<integer></integer>
[1] 11	13	3	1	a	3
[2] 12	14	3	1	Ъ	2
[3] 13	15	3	1	С	1
[4] 2	4	3	1	d	0
[5] 7	9	3	1	е	-1
[6] 6	8	3	1	f	-2

> ir2 <- reduce(ir, with.revmap=TRUE)</pre>

IRanges object with 3 ranges and 1 metadata column:

revmap	-	width	end	start	
<integerlist></integerlist>	-	<integer></integer>	<integer></integer>	<integer></integer>	
4	1	3	4	2	[1]
6,5	1	4	9	6	[2]
1,2,3	1	5	15	11	[3]

> ir2

4. 'with.revmap' arg for reduce() and disjoin()

```
> revmap <- mcols(ir2)$revmap
> extractList(mcols(ir)$id, revmap)
CharacterList of length 3
[[1]] d
[[2]] f e
[[3]] a b c
> extractList(mcols(ir)$score, revmap)
IntegerList of length 3
[[1]] 0
[[2]] -2 -1
[[3]] 3 2 1
> mcols(ir2) <- DataFrame(id=extractList(mcols(ir)$id, revmap),
                         score=extractList(mcols(ir)$score, revmap))
+
> ir2
IRanges object with 3 ranges and 2 metadata columns:
                     end
          start.
                             width |
                                                   id
                                                              score
      <integer> <integer> | <CharacterList> <IntegerList>
  Γ17
             2
                       4
                                 3 I
                                                   d
  [2]
                                                            -2.-1
                                 4 I
                                                 f.e
  [3]
            11
                       15
                                 5 I
                                                a.b.c
                                                             3.2.1
```

5. Zero-width ranges

findOverlaps/countOverlaps support zero-width ranges.

```
> sliding_query <- IRanges(1:6, width=0)</pre>
```

> sliding_query

IRanges object with 6 ranges and 0 metadata columns:

	Start	ena	width
	<integer></integer>	<integer></integer>	<integer></integer>
[1]	1	0	0
[2]	2	1	0
[3]	3	2	0
[4]	4	3	0
[5]	5	4	0
[6]	6	5	0

> countOverlaps(sliding_query, IRanges(3, 4))

[1] 0 0 0 1 0 0

But you have to specify minoverlap=0 for this to work (default is 1).

```
> countOverlaps(sliding_query, IRanges(3, 4), minoverlap=0)
[1] 0 0 0 1 0 0
```

Perform multiple substitutions at arbitrary positions in a set of sequences.

```
> library(Biostrings)
> library(hgu95av2probe)
> probes <- DNAStringSet(hgu95av2probe)</pre>
> probes
DNAStringSet object of length 201800:
        width seq
     [1]
            25 TGGCTCCTGCTGAGGTCCCCTTTCC
     [2] 25 GGCTGTGAATTCCTGTACATATTTC
     [3]
            25 GCTTCAATTCCATTATGTTTTAATG
[201798] 25 TTCTGTCAAAGCATCATCTCAACAA
[201799] 25 CAAAGCATCATCTCAACAAGCCCTC
[201800]
           25 GTGCTCCTTGTCAACAGCGCACCCA
```

```
Replace 3rd and 4th nucleotides by pattern -++-.
> replaceAt(probes, at=IRanges(3, 4), value="-++-")
DNAStringSet object of length 201800:
         width seq
     [1]
            27 TG-++-TCCTGCTGAGGTCCCCTTTCC
     [2] 27 GG-++-GTGAATTCCTGTACATATTTC
     [3]
           27 GC-++-CAATTCCATTATGTTTTAATG
[201798] 27 TT-++-GTCAAAGCATCATCTCAACAA
[201799] 27 CA-++-GCATCATCTCAACAAGCCCTC
[201800] 27 GT-++-TCCTTGTCAACAGCGCACCCA
```

If supplied pattern is empty, then performs deletions.

If at is a zero-with range, then performs insertions.

```
> replaceAt(probes, at=IRanges(4, 3), value="-++-")

DNAStringSet object of length 201800:
    width seq
[1] 29 TGG-++-CTCCTGCTGAGGTCCCCTTTCC
[2] 29 GGC-++-TGTGAATTCCTGTACATATTTC
[3] 29 GCT-++-TCAATTCCATTATGTTTTAATG
...
[201798] 29 TTC-++-TGTCAAAGCATCATCTCAACAA
[201799] 29 CAA-++-AGCATCATCTCAACAAGCCCTC
[201800] 29 GTG-++-CTCCTTGTCAACAGCGCACCCA
```

Use it in combination with <code>vmatchPattern</code> to replace all the occurences of a given pattern with another pattern:

7. GRanges as a subscript

```
